

LSAP and ND GAIN Map Project Documentation

Countries and episcopal conferences

Analysis run 4 October 2026 | Documentation 5 October 2026

This document explains the 30 maps in the LSAP ND-GAIN ArcGIS Pro project: 15 episcopal conference maps and 15 country maps. It brings the data sources, calculations, spatial relationships, classification rules and intended uses into one reference for researchers, Church partners and atlas reviewers.

The maps connect national adaptation context with recorded LSAP participation. They can guide discussion and identify records or places for further review. Their colors do not establish the effectiveness of Church activity or the location and performance of individual projects.

Project scope

Item	Documented scope
Map collection	E01 to E15 conferences and C01 to C15 countries
ND-GAIN release	2026 release with annual columns from 1995 through 2024
Country analysis	246 mapped country or territory records with 190 available 2024 ND-GAIN scores
Conference analysis	122 source geometries with 120 available ND-GAIN context summaries
Presentation	30 styled maps and layer files with six overview layouts
Primary project	LSAP_ND_GAIN.aprx with ND_GAIN_LSAP.gdb

How to use this reference

Read the shared methods before interpreting any map. Use the map identifier to find the corresponding catalog entry. Each entry gives the inputs, formula, class cutpoints, available record count, an illustration and a suggested next step. The final sections provide exact source fields, quality checks and the package inventory.

[Open the ArcGIS Pro project](#)

[Open the companion map guide](#)

Navigation: shared methods pages 2 to 6; conference maps pages 7 to 14; country maps pages 15 to 22; source and derived fields pages 23 to 25; geographic review page 26; project files page 27; references page 28.

Data sources and adaptation context

The ND GAIN Country Index

ND-GAIN describes national vulnerability to climate change and readiness for adaptation investment. Vulnerability spans food, water, health, ecosystem services, human habitat and infrastructure, with exposure, sensitivity and adaptive capacity components. Readiness covers economic, governance and social conditions. Higher vulnerability indicates greater need; higher readiness indicates more favorable enabling conditions. [1, 2]

ND-GAIN score = (readiness - vulnerability + 1) × 50. This project uses the unadjusted index. The local CSV files contain 192 ISO3 country records; 190 have an available overall score in 2024. The year 2026 identifies the release, not the observation year used in the maps. [3]

The technical report explains that missing observations can be interpolated or carried forward and some exposure inputs are projections. B-READY replaces Doing Business for economic readiness from 2022, with regional placeholders where data are pending. Changes across that transition require care. The official matrix uses historical medians; E01 instead uses medians from this release's 2024 values. [1]

LSAP statistics

The Laudato Si' Action Platform supports journeys of integral ecology across Church and community sectors. [4] The country statistics in this project record enrollments, plans, actions and participation categories. These are reported activity counts. They do not constitute an inventory of uniquely identified projects or measure adaptation outcomes.

LSAP_MemberData_w_HolySeeStats__Country is the statistical source and has point geometry. Its 248 records include national ecclesiastical statistics such as recorded Catholics. The source total fields have no explicit snapshot date in their names. Fields labeled _26 or 2026 are preserved as reported 2026 activity; their relationship to the total snapshot is not assumed.

Episcopal conference records

EpiscopalConfere_SpatialJoin supplies 122 polygon geometries, recorded conference names and ecclesiastical attributes. The collection includes regional bodies, collaborating arrangements and territories directly subject to the Holy See. The record count therefore describes supplied geometries rather than a verified legal count of episcopal conferences.

The conference source also contains country LSAP attributes from a previous join. Those inherited attributes are preserved in the foundation copy but do not drive the new analysis. Derived NG fields recompute national context through the country crosswalk. Recorded presidents, Catholic populations and parishes are contextual source attributes; their freshness is not independently certified.

Country joins and conference summaries

Country matching

World_Countries_Generalized supplies 251 country polygon features. Its ISO2 code is matched to USER_ISO_2_CODE in the LSAP source; USER_ISO_3_CODE then links the record to ND-GAIN. The matching code recognizes UK as GB and KV as XK. Territories without a separate available ND-GAIN observation do not inherit their sovereign state's score.

Duplicate LSAP ISO3 records occur for VAT, MDA and TZA. The retained record has the greatest count of non-null USER fields; equal completeness retains the first encountered record. The selection is a completeness rule, not a certification of accuracy. Duplicate statistics are never added. Polygon pieces sharing an ISO3 code are joined into one national geometry and retain a single statistical record. This reduces 251 input features to 246 analytical records.

Spatial country associations

Conference and country polygon copies are projected to EPSG 6933 for equal-area intersection. Each overlap records its area and its fraction of both input polygons. An association is retained when the overlap covers at least 50 percent of the input country polygon feature or at least 1 percent of the conference polygon. The crosswalk retains names, source IDs, ISO3 codes, fractions and LSAP eligibility.

Fractions refer to the input polygon features before national pieces are merged. They indicate geometric association and do not verify ecclesiastical membership. Generalized coastlines, small islands and unusual or overlapping jurisdictions require manual review. Repeated polygon pieces are deduplicated by ISO3 for summary calculations; unmatched units retain their polygon identity.

Scores and counts follow different rules

A conference's ND-GAIN context is the unweighted arithmetic mean of available scores across retained unique associated units. Each metric uses its own available observations. It is neither area-weighted nor Catholic-population-weighted. Available units may differ between metrics. NG_NDCount reports coverage of the overall score, not completeness of every sector.

Conference LSAP totals use only units with at least 50 percent of the input country polygon covered. Every contributing value must be present for each summed measure to be available. The same eligible units supply the national Catholic denominator. A positive denominator is required for a ratio. National counts are not allocated by overlap area and cannot locate registrants inside a conference boundary.

E03 is a distinct screening calculation: it considers all retained high-vulnerability associated units, including partial-country associations, and checks their national enrollment records for zero. Conference summaries overlap and must not be summed into a global total. The source conference Catholic and parish figures remain separate from the national denominators.

Measures used across the maps

Vulnerability components and sectors use the 2024 CSV column unless a catalog entry specifies a change from 2014. LSAP measures use the source total snapshot unless explicitly labeled 2026. Derived measures are stored under the NG prefix.

Measure	Calculation or interpretation
Enrollments per million recorded catholics	$\text{Enrollment} / \text{recorded Catholics} \times 1,000,000$
Plans per 100 enrollments	$\text{Total plans} / \text{total enrollment} \times 100$
Actions per 100 enrollments	$\text{Total actions} / \text{total enrollment} \times 100$
Family and individual enrollment share	$\text{Family and individual enrollment} / \text{total enrollment} \times 100$
Parish enrollment share	$\text{Parish enrollment} / \text{total enrollment} \times 100$
Health institution enrollment share	$\text{Health institution enrollment} / \text{total enrollment} \times 100$
Religious enrollment share	$(\text{Religious congregation enrollment} + \text{religious community enrollment}) / \text{total enrollment} \times 100$
Economic entity enrollment share	$\text{Economic entity enrollment} / \text{total enrollment} \times 100$
Education enrollment share	$(\text{School enrollment} + \text{university enrollment}) / \text{total enrollment} \times 100$
Community resilience actions per 100 enrollments	$\text{Community resilience and empowerment actions} / \text{total enrollment} \times 100$
Cry of the poor actions per 100 enrollments	$\text{Response to the Cry of the Poor actions} / \text{total enrollment} \times 100$
Cry of the earth actions per 100 enrollments	$\text{Response to the Cry of the Earth actions} / \text{total enrollment} \times 100$
2026 enrollments divided by total snapshot enrollment	$\text{Reported 2026 enrollment} / \text{total snapshot enrollment} \times 100$
2026 plans per 100 total snapshot enrollments	$\text{Reported 2026 plans} / \text{total snapshot enrollment} \times 100$

Enrollment shares measure the composition of recorded enrollment, not the extent of all Church institutions in a country. Education adds school and university enrollment. Religious participation adds congregation and community enrollment. Component sums require both inputs.

Plans and actions per 100 enrollments describe activity intensity. They can exceed 100 because the numerator may count multiple activities per enrollment. They are not percentages of participants who completed a plan or project. The 2026 ratios compare a period-labeled count with a total-snapshot denominator and are not cohort conversion rates.

Map classifications and interpretation

Two variable maps

Twenty-seven maps combine an ND-GAIN context measure with an LSAP measure. Each variable is classified separately within its geographic scale using all available values for that variable, not only records complete on both axes. For n sorted values, the two cutpoints are values at zero-based indices $\text{floor}((n - 1) / 3)$ and $\text{floor}(2 \times (n - 1) / 3)$.

Lower includes values at or below the first cutpoint. Middle includes values above the first and at or below the second. Higher includes values above the second. Equal values stay together. A zero-heavy distribution can give identical cutpoints and an empty middle class. Classification is relative within each scale; a color does not represent a universal threshold of need or performance.

Context level	Lower LSAP	Middle LSAP	Higher LSAP
Higher	Higher context lower activity	Higher context middle activity	Higher context higher activity
Middle	Middle context lower activity	Middle context middle activity	Middle context higher activity
Lower	Lower context lower activity	Lower context middle activity	Lower context higher activity

Rows encode context and columns encode LSAP activity. Higher vulnerability, exposure, sensitivity or capacity deficit is less favorable; higher social or governance readiness is more favorable. Higher ND-GAIN score change denotes greater improvement, whereas higher vulnerability change denotes worsening. Gray represents unavailable inputs and must not be read as zero.

The three categorical conference maps

E01 uses custom 2024 medians: vulnerability 0.449648571 and readiness 0.387325572. Values equal to a median enter the high class. The four combinations are shown in red, blue, yellow and green. This is a release-specific peer matrix rather than a reproduction of the official historical-median matrix.

E02 selects the greatest of the six available sector means and requires all six sector means to be present. An exact tie follows the stored sector order: food, water, health, ecosystems, habitat and infrastructure. E03 distinguishes zero unreached, more than zero through 50 percent unreached, and more than 50 percent unreached. No qualifying peers or incomplete enrollment data remains gray.

Coverage and quality checks

Check	Result
Saved project read audit	30 maps and 6 layouts; 0 broken thematic layers
ND-GAIN score coverage	190 of 246 country or territory records; 120 of 122 conference geometries
Conference enrollment availability	93 available contextual totals; 29 unavailable totals
Bivariate map availability	Country maps 121 to 140 records; conference maps 81 to 90 records
Categorical map availability	E01 120 records; E02 109 records; E03 43 records
Score equation check	Maximum absolute difference approximately 5.7×10^{-14} on complete source records
Source preservation	Original project hash unchanged in the saved validation report

Coverage refers to usable values in this run, not participation coverage of the world Church. The E03 count is especially sensitive to whether a conference has any higher-vulnerability associated units and whether all their enrollment values are known. A gray record may indicate no qualifying peers as well as missing data.

Limits on inference

National scores cannot identify the flood, heat or food-security conditions of a parish site. Conference means summarize multiple national contexts and may obscure variation. Their score coverage counts do not prove that each sector uses the same countries. The current source totals and ecclesiastical denominators require local validation before outreach targets or budgets are set.

Some conference polygons include only part of a country. Even when a country qualifies for an LSAP total, its complete national count can include registrants outside that conference. Small polygon units and overlapping jurisdictions can also create ambiguous associations. The country crosswalk is a review aid, not an authoritative directory of conference membership.

The maps align LSAP sectors or action themes with ND-GAIN context. A school enrollment does not prove climate education activity; an action labeled Cry of the Earth does not prove adaptation to the specific exposure represented by ND-GAIN. The recommended uses below are opportunities for further conversation and assessment.

Using the maps in decisions

Begin with a geographic and data-quality review. Inspect the feature popup and the underlying country associations. Confirm source periods, zero records and denominators with relevant partners. Then select local hazards, institutions and actions for a more detailed assessment. Recompute classifications when source values, matching rules or release years change.

Episcopal conference map catalog

All entries use the shared methods above. The suggested uses are practical prompts for local assessment. Available records are counted from the saved classification field.

E01 A pastoral compass for adaptation

Which national contexts combine urgent need and readiness?

Inputs and calculation Compare mean 2024 vulnerability and mean 2024 readiness with the global medians stated above. Four combinations describe adaptation need and readiness; missing either score leaves the record unavailable.

Coverage and storage 120 of 122 records have a usable classification. Class field NG_E01; explanation field NG_E01_Story. Custom matrix using 2024 global country medians; conference scores are equal-country means.

Illustration Antilles Episcopal Conference is classified as Lower vulnerability / high readiness. This illustrates a saved record rather than a verified local priority.

Suggested use Use the four contexts to open a conference discussion on support and investment.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

E02 The first adaptation conversation

Which vulnerability sector has the highest mean score?

Inputs and calculation Select the largest of the food, water, health, ecosystems, habitat and infrastructure means. All six means must be present. The highest sector is a relative vulnerability profile, not evidence that a specific project is appropriate.

Coverage and storage 109 of 122 records have a usable classification. Class field NG_E02; explanation field NG_E02_Story. Largest of six sector means; not evidence of project suitability.

Illustration Antilles Episcopal Conference is classified as Food. This illustrates a saved record rather than a verified local priority.

Suggested use Start a locally validated adaptation agenda with this sector.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Episcopal conference map catalog continued

E03 Reach the unreached in vulnerable contexts

What share of high-vulnerability associated units report zero enrollment?

Inputs and calculation $100 \times$ associated high-vulnerability units with zero national enrollment / all associated high-vulnerability units. High vulnerability is at least 0.449648571. Every qualifying unit must have known enrollment. Classes are zero, greater than zero through 50 percent, and greater than 50 percent.

Coverage and storage 43 of 122 records have a usable classification. Class field NG_E03; explanation field NG_E03_Story. Percent of higher-vulnerability associated units; missing enrollment prevents calculation.

Illustration Bishops' Conference of Burkina Faso and Niger is classified as Zero unreached. The screening percentage is 0.000 percent. This illustrates a saved record rather than a verified local priority.

Suggested use Verify zero records and offer outreach to local Church partners.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

E04 A wider invitation to integral ecology

Where does greater need meet limited participation?

Inputs and calculation Context is overall vulnerability from vulnerability/vulnerability.csv, using 2024. LSAP measure: Enrollment / recorded Catholics $\times$ 1,000,000. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.389774 and 0.477614. LSAP cutpoints 6.729203 and 17.805773. The lower middle higher rules on the classification page apply.

Coverage and storage 90 of 122 records have a usable classification. Class field NG_E04; explanation field NG_E04_Story. Enrollment per million recorded Catholics.

Illustration Catholic Bishops' Conference of Vietnam has overall vulnerability 0.498957 and enrollments per million recorded Catholics 3.938. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Support invitation and training in national contexts with low recorded reach.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Episcopal conference map catalog continued

E05 From commitment to a written plan

Where is planning activity limited relative to enrollment and need?

Inputs and calculation Context is overall vulnerability from vulnerability/vulnerability.csv, using 2024. LSAP measure: Total plans / total enrollment × 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.389774 and 0.477614. LSAP cutpoints 0.000000 and 8.661417. The lower middle higher rules on the classification page apply.

Coverage and storage 87 of 122 records have a usable classification. Class field NG_E05; explanation field NG_E05_Story. Plans per 100 enrollments.

Illustration Catholic Bishops' Conference of Bangladesh has overall vulnerability 0.543534 and plans per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Offer accompaniment for writing and reviewing plans.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

E06 Making action visible

Where is recorded action activity stronger or weaker relative to need?

Inputs and calculation Context is overall vulnerability from vulnerability/vulnerability.csv, using 2024. LSAP measure: Total actions / total enrollment × 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.389774 and 0.477614. LSAP cutpoints 0.000000 and 36.324786. The lower middle higher rules on the classification page apply.

Coverage and storage 86 of 122 records have a usable classification. Class field NG_E06; explanation field NG_E06_Story. Actions per 100 enrollments.

Illustration Catholic Bishops' Conference of Bangladesh has overall vulnerability 0.543534 and actions per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Invite documentation and exchange of practical experience.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Episcopal conference map catalog continued

E07 Food security and household solidarity

Where do food vulnerability and household participation intersect?

Inputs and calculation Context is food vulnerability from vulnerability/food.csv, using 2024. LSAP measure: Family and individual enrollment / total enrollment $\times$ 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.393685 and 0.546254. LSAP cutpoints 40.425532 and 52.567237. The lower middle higher rules on the classification page apply.

Coverage and storage 89 of 122 records have a usable classification. Class field NG_E07; explanation field NG_E07_Story. Family and individual enrollment share (%).

Illustration Catholic Bishops' Conference of Bangladesh has food vulnerability 0.582111 and family and individual enrollment share 25.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Explore locally appropriate food and household resilience work.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

E08 Water stewardship through parishes

Where can parish networks discuss national water vulnerability?

Inputs and calculation Context is water vulnerability from vulnerability/water.csv, using 2024. LSAP measure: Parish enrollment / total enrollment $\times$ 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.430268 and 0.515146. LSAP cutpoints 0.000000 and 4.545455. The lower middle higher rules on the classification page apply.

Coverage and storage 89 of 122 records have a usable classification. Class field NG_E08; explanation field NG_E08_Story. Parish enrollment share (%).

Illustration Catholic Bishops' Conference of Romania has water vulnerability 0.554687 and parish enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Assess water access and conservation needs locally.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Episcopal conference map catalog continued

E09 Health ministries in a changing climate

Where are health institutions participating amid health vulnerability?

Inputs and calculation Context is health vulnerability from vulnerability/health.csv, using 2024. LSAP measure: Health institution enrollment / total enrollment × 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.311894 and 0.538803. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 89 of 122 records have a usable classification. Class field NG_E09; explanation field NG_E09_Story. Health-institution enrollment share (%).

Illustration Bishops' Conference of Burkina Faso and Niger has health vulnerability 0.737887 and health institution enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Invite health partners to assess preparedness and continuity of care.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

E10 Religious communities caring for creation

Where do religious networks intersect with ecosystem vulnerability?

Inputs and calculation Context is ecosystem services vulnerability from vulnerability/ecosystems.csv, using 2024. LSAP measure: (Religious congregation enrollment + religious community enrollment) / total enrollment × 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.421476 and 0.495303. LSAP cutpoints 9.433962 and 19.565217. The lower middle higher rules on the classification page apply.

Coverage and storage 89 of 122 records have a usable classification. Class field NG_E10; explanation field NG_E10_Story. Religious congregation plus community enrollment share (%).

Illustration Argentine Episcopal Conference has ecosystem services vulnerability 0.519148 and religious enrollment share 8.247. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Discuss locally informed ecosystem restoration and stewardship.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Episcopal conference map catalog continued

E11 Parishes as places of refuge

Where can parish participation support habitat adaptation conversations?

Inputs and calculation Context is human habitat vulnerability from vulnerability/habitat.csv, using 2024. LSAP measure: Parish enrollment / total enrollment × 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.478136 and 0.560228. LSAP cutpoints 0.000000 and 4.545455. The lower middle higher rules on the classification page apply.

Coverage and storage 89 of 122 records have a usable classification. Class field NG_E11; explanation field NG_E11_Story. Parish enrollment share (%).

Illustration Bishops' Conference of Burkina Faso and Niger has human habitat vulnerability 0.595833 and parish enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Review heat, flood and shelter preparedness at parish sites.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

E12 Economic actors and resilient infrastructure

Where does infrastructure vulnerability meet economic-entity participation?

Inputs and calculation Context is infrastructure vulnerability from vulnerability/infrastructure.csv, using 2024. LSAP measure: Economic entity enrollment / total enrollment × 100. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.212861 and 0.299610. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 81 of 122 records have a usable classification. Class field NG_E12; explanation field NG_E12_Story. Economic-entity enrollment share (%).

Illustration Catholic Bishops' Conference of Bangladesh has infrastructure vulnerability 0.333158 and economic entity enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Explore resilient utilities and supply-chain partnerships.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Episcopal conference map catalog continued

E13 Education as a bridge to readiness

Where are schools and universities participating amid differing social readiness?

Inputs and calculation Context is social readiness from readiness/social.csv, using 2024. LSAP measure: $(\text{School enrollment} + \text{university enrollment}) / \text{total enrollment} \times 100$. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.287209 and 0.421484. LSAP cutpoints 0.000000 and 12.695925. The lower middle higher rules on the classification page apply.

Coverage and storage 89 of 122 records have a usable classification. Class field NG_E13; explanation field NG_E13_Story. School plus university enrollment share (%).

Illustration Bishops' Conference of the Netherlands has social readiness 0.605283 and education enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Share learning resources and invite underrepresented education networks.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

E14 Planning within governance constraints

Where is 2026 planning activity occurring amid differing governance readiness?

Inputs and calculation Context is governance readiness from readiness/governance.csv, using 2024. LSAP measure: $\text{Reported 2026 plans} / \text{total snapshot enrollment} \times 100$. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints 0.381027 and 0.515089. LSAP cutpoints 0.000000 and 1.408451. The lower middle higher rules on the classification page apply.

Coverage and storage 87 of 122 records have a usable classification. Class field NG_E14; explanation field NG_E14_Story. 2026 plans per 100 total-snapshot enrollments.

Illustration Austrian Bishops' Conference has governance readiness 0.746143 and 2026 plans per 100 total snapshot enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Tailor implementation support to national institutional conditions.

Review before use 2026 activity is compared with total snapshot enrollment, not a defined cohort.

Episcopal conference map catalog continued

E15 A decade of vulnerability and a call to resilience

Where is vulnerability worsening alongside community-resilience activity?

Inputs and calculation Context is change in vulnerability from 2014 to 2024 from vulnerability/vulnerability.csv, using 2024 minus 2014. LSAP measure: Community resilience and empowerment actions / total enrollment $\times 100$. Conference scores are means; eligible national counts are summed before ratios are calculated.

Classification Context cutpoints -0.011450 and -0.003450. LSAP cutpoints 0.000000 and 2.893891. The lower middle higher rules on the classification page apply.

Coverage and storage 86 of 122 records have a usable classification. Class field NG_E15; explanation field NG_E15_Story. 2024 minus 2014 vulnerability; resilience actions per 100 enrollments.

Illustration Bishops' Conference of Burkina Faso and Niger has change in vulnerability from 2014 to 2024 -0.002718 and community resilience actions per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Discuss trends with partners before selecting local priorities.

Review before use Trend values cross methodological and source changes; no change is attributed to LSAP.

Reviewing this map collection

Use the collection to identify questions that warrant deeper examination. Compare neighboring and associated countries, inspect the underlying counts rather than color alone, and distinguish a true zero from an unavailable value. Operational decisions should follow locally verified needs and partner consultation.

Country map catalog

All entries use the shared methods above. The suggested uses are practical prompts for local assessment. Available records are counted from the saved classification field.

C01 Adaptation need and the LSAP invitation

Where does national vulnerability meet low recorded LSAP reach?

Inputs and calculation Context is overall vulnerability from vulnerability/vulnerability.csv, using 2024. LSAP measure: Enrollment / recorded Catholics $\times$ 1,000,000. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.406680 and 0.484819. LSAP cutpoints 6.169269 and 22.893299. The lower middle higher rules on the classification page apply.

Coverage and storage 140 of 246 records have a usable classification. Class field NG_C01; explanation field NG_C01_Story. Enrollments per million recorded Catholics.

Illustration Angola has overall vulnerability 0.527907 and enrollments per million recorded Catholics 3.729. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Prioritize outreach after validating the enrollment and Catholic denominator.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

C02 Turning participation into plans

How does planning intensity vary with vulnerability?

Inputs and calculation Context is overall vulnerability from vulnerability/vulnerability.csv, using 2024. LSAP measure: Total plans / total enrollment $\times$ 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.406680 and 0.484819. LSAP cutpoints 0.000000 and 6.521739. The lower middle higher rules on the classification page apply.

Coverage and storage 131 of 246 records have a usable classification. Class field NG_C02; explanation field NG_C02_Story. Plans per 100 enrollments.

Illustration Bahrain has overall vulnerability 0.498975 and plans per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Offer planning workshops where need is higher and recorded planning is lower.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Country map catalog continued

C03 Action in places of adaptation need

How does action intensity vary with vulnerability?

Inputs and calculation Context is overall vulnerability from vulnerability/vulnerability.csv, using 2024. LSAP measure: Total actions / total enrollment $\times$ 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.406680 and 0.484819. LSAP cutpoints 0.000000 and 28.213309. The lower middle higher rules on the classification page apply.

Coverage and storage 129 of 246 records have a usable classification. Class field NG_C03; explanation field NG_C03_Story. Actions per 100 enrollments.

Illustration Bahrain has overall vulnerability 0.498975 and actions per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Identify examples to learn from and gaps in documentation.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

C04 Schools and universities building readiness

Where does education participation meet low national social readiness?

Inputs and calculation Context is social readiness from readiness/social.csv, using 2024. LSAP measure: (School enrollment + university enrollment) / total enrollment $\times$ 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.286798 and 0.410377. LSAP cutpoints 0.000000 and 9.923664. The lower middle higher rules on the classification page apply.

Coverage and storage 134 of 246 records have a usable classification. Class field NG_C04; explanation field NG_C04_Story. School plus university enrollment share (%).

Illustration Belarus has social readiness 0.491383 and education enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Build education partnerships and accessible learning support.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Country map catalog continued

C05 Health partners answering climate vulnerability

Where are health institutions enrolled amid health vulnerability?

Inputs and calculation Context is health vulnerability from vulnerability/health.csv, using 2024. LSAP measure: Health institution enrollment / total enrollment $\times$ 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.327968 and 0.516880. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 134 of 246 records have a usable classification. Class field NG_C05; explanation field NG_C05_Story. Health-institution enrollment share (%).

Illustration Angola has health vulnerability 0.627824 and health institution enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Invite health partners to develop locally assessed preparedness plans.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

C06 Parish networks and human habitat

Where do parish networks meet habitat vulnerability?

Inputs and calculation Context is human habitat vulnerability from vulnerability/habitat.csv, using 2024. LSAP measure: Parish enrollment / total enrollment $\times$ 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.460324 and 0.551570. LSAP cutpoints 0.000000 and 4.225352. The lower middle higher rules on the classification page apply.

Coverage and storage 135 of 246 records have a usable classification. Class field NG_C06; explanation field NG_C06_Story. Parish enrollment share (%).

Illustration Burkina Faso has human habitat vulnerability 0.577067 and parish enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Discuss heat-safe spaces, flood preparedness and shelter locally.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Country map catalog continued

C07 Families and the future of food

Where does household participation intersect with food vulnerability?

Inputs and calculation Context is food vulnerability from vulnerability/food.csv, using 2024. LSAP measure: Family and individual enrollment / total enrollment $\times$ 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.397329 and 0.525076. LSAP cutpoints 38.181818 and 54.954955. The lower middle higher rules on the classification page apply.

Coverage and storage 134 of 246 records have a usable classification. Class field NG_C07; explanation field NG_C07_Story. Family and individual enrollment share (%).

Illustration Antigua and Barbuda has food vulnerability 0.664384 and family and individual enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Explore food resilience and solidarity with households.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

C08 Economic entities and infrastructure resilience

Where does infrastructure vulnerability meet economic participation?

Inputs and calculation Context is infrastructure vulnerability from vulnerability/infrastructure.csv, using 2024. LSAP measure: Economic entity enrollment / total enrollment $\times$ 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.212861 and 0.326095. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 121 of 246 records have a usable classification. Class field NG_C08; explanation field NG_C08_Story. Economic-entity enrollment share (%).

Illustration Albania has infrastructure vulnerability 0.375412 and economic entity enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Invite economic entities into resilience partnerships.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Country map catalog continued

C09 Religious life and ecosystem stewardship

Where can religious networks engage ecosystem vulnerability?

Inputs and calculation Context is ecosystem services vulnerability from vulnerability/ecosystems.csv, using 2024. LSAP measure: (Religious congregation enrollment + religious community enrollment) / total enrollment × 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.421446 and 0.519148. LSAP cutpoints 5.263158 and 18.897638. The lower middle higher rules on the classification page apply.

Coverage and storage 135 of 246 records have a usable classification. Class field NG_C09; explanation field NG_C09_Story. Religious congregation plus community enrollment share (%).

Illustration Belize has ecosystem services vulnerability 0.520123 and religious enrollment share 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Assess local stewardship opportunities with religious communities.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

C10 Community empowerment and capacity deficits

Where do adaptation-capacity deficits meet resilience actions?

Inputs and calculation Context is adaptive capacity deficit from vulnerability/capacity.csv, using 2024. LSAP measure: Community resilience and empowerment actions / total enrollment × 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.450050 and 0.592087. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 126 of 246 records have a usable classification. Class field NG_C10; explanation field NG_C10_Story. Capacity score is a deficit; resilience actions per 100 enrollments.

Illustration Antigua and Barbuda has adaptive capacity deficit 0.603138 and community resilience actions per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Offer accompaniment where national capacity deficits are higher.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Country map catalog continued

C11 Hearing the cry of the poor

Where does climate sensitivity intersect with recorded cry-of-the-poor actions?

Inputs and calculation Context is climate sensitivity from vulnerability/sensitivity.csv, using 2024. LSAP measure: Response to the Cry of the Poor actions / total enrollment × 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.288808 and 0.364077. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 128 of 246 records have a usable classification. Class field NG_C11; explanation field NG_C11_Story. Cry-of-the-poor actions per 100 enrollments.

Illustration Bahrain has climate sensitivity 0.416402 and cry of the poor actions per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Discuss solidarity priorities with locally affected communities.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

C12 Hearing the cry of the Earth

Where does projected exposure intersect with cry-of-the-Earth actions?

Inputs and calculation Context is climate exposure from vulnerability/exposure.csv, using 2024. LSAP measure: Response to the Cry of the Earth actions / total enrollment × 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.468831 and 0.521241. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 129 of 246 records have a usable classification. Class field NG_C12; explanation field NG_C12_Story. Cry-of-the-Earth actions per 100 enrollments.

Illustration Antigua and Barbuda has climate exposure 0.539794 and cry of the Earth actions per 100 enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Use exposure context to frame locally assessed adaptation and stewardship.

Review before use Source denominators and reporting completeness should be confirmed before comparisons guide decisions.

Country map catalog continued

C13 The 2026 invitation in vulnerable countries

Where is reported 2026 enrollment activity concentrated?

Inputs and calculation Context is overall vulnerability from vulnerability/vulnerability.csv, using 2024. LSAP measure: Reported 2026 enrollment / total snapshot enrollment × 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.406680 and 0.484819. LSAP cutpoints 8.695652 and 20.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 132 of 246 records have a usable classification. Class field NG_C13; explanation field NG_C13_Story. 2026 enrollment count divided by total-snapshot enrollment (%).

Illustration Bahrain has overall vulnerability 0.498975 and 2026 enrollments divided by total snapshot enrollment 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Review outreach experience and seek partners in underserved contexts.

Review before use 2026 activity is compared with total snapshot enrollment, not a defined cohort.

C14 2026 plans and governance readiness

Where do reported 2026 plans intersect with governance readiness?

Inputs and calculation Context is governance readiness from readiness/governance.csv, using 2024. LSAP measure: Reported 2026 plans / total snapshot enrollment × 100. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints 0.405724 and 0.587106. LSAP cutpoints 0.000000 and 0.000000. The lower middle higher rules on the classification page apply.

Coverage and storage 132 of 246 records have a usable classification. Class field NG_C14; explanation field NG_C14_Story. 2026 plans per 100 total-snapshot enrollments.

Illustration Andorra has governance readiness 0.761899 and 2026 plans per 100 total snapshot enrollments 0.000. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Tailor institutional support for implementation.

Review before use 2026 activity is compared with total snapshot enrollment, not a defined cohort.

Country map catalog continued

C15 A decade of adaptation progress and LSAP reach

Where has ND-GAIN improved or declined alongside recorded reach?

Inputs and calculation Context is change in ND-GAIN score from 2014 to 2024 from gain/gain.csv, using 2024 minus 2014. LSAP measure: Enrollment / recorded Catholics × 1,000,000. Counts and scores are joined by ISO3 to one national record.

Classification Context cutpoints -0.623487 and 1.246991. LSAP cutpoints 6.169269 and 22.893299. The lower middle higher rules on the classification page apply.

Coverage and storage 140 of 246 records have a usable classification. Class field NG_C15; explanation field NG_C15_Story. 2024 minus 2014 ND-GAIN points; enrollment per million Catholics.

Illustration Andorra has change in ND-GAIN score from 2014 to 2024 5.042700 and enrollments per million recorded Catholics 0.055. Its saved class is higher context / lower lsap. This illustrates the calculation and is not a recommendation or ranking.

Suggested use Study national trajectories and exchange lessons without attributing change to LSAP.

Review before use Trend values cross methodological and source changes; no change is attributed to LSAP.

Reviewing this map collection

Use the collection to identify questions that warrant deeper examination. Compare neighboring and associated countries, inspect the underlying counts rather than color alone, and distinguish a true zero from an unavailable value. Operational decisions should follow locally verified needs and partner consultation.

LSAP source field dictionary

The following exact field names identify the original inputs. Derived NG fields are analytical outputs; the country foundation retains the original attributes for traceability. Long field names are wrapped for readability.

Measure	Original source field or component sum
Enrollment	USER_Enrolled_total
2026 enrollment	USER_Enrolled_total_26
Plans	USER_Total_Plans
2026 plans	USER_Total_Plans_2026
Actions	USER_Total_Actions
2026 actions	USER_Total_Actions_2026
Education enrollments	USER_School_Enrolled_Cnt + USER_Uni_Enrolled_Cnt
Health institution enrollments	USER_HealthInst_Enrolled_Cnt
Parish enrollments	USER_Parish_Enrolled_Cnt
Family/individual enrollments	USER_FamIndv_Enrolled_Cnt
Economic-entity enrollments	USER_EconEn_Enrolled_Cnt
Religious enrollments	USER_ReligiousCong_Enrolled_Cnt + USER_Religious_Com_Enrolled_Cnt
Community-resilience actions	USER_Community_resilience_and_empowerment
Cry-of-the-poor actions	USER_Response_to_the_Cry_of_the_Poor
Cry-of-the-Earth actions	USER_Response_to_the_Cry_of_the_Earth
Catholic denominator	SUM_Catholics (national records, deduplicated)

Fields related to reflections and certificates are retained in the analysis records as NG_Reflections and NG_Certificates but are not used as thematic axes in the 30-map collection. NG_Actions26 is also retained as contextual data. Their presence does not imply an additional map or a verified participant outcome.

ND GAIN input files

Context measure	File within resources 2
Nd-gain score	gain/gain.csv
Overall vulnerability	vulnerability/vulnerability.csv
Overall readiness	readiness/readiness.csv
Food vulnerability	vulnerability/food.csv
Water vulnerability	vulnerability/water.csv
Health vulnerability	vulnerability/health.csv
Ecosystem services vulnerability	vulnerability/ecosystems.csv
Human habitat vulnerability	vulnerability/habitat.csv
Infrastructure vulnerability	vulnerability/infrastructure.csv
Climate exposure	vulnerability/exposure.csv
Climate sensitivity	vulnerability/sensitivity.csv
Adaptive capacity deficit	vulnerability/capacity.csv
Social readiness	readiness/social.csv
Governance readiness	readiness/governance.csv
Economic readiness	readiness/economic.csv

All files join on ISO3. The 2024 column supplies the current context. NG_GainChange and NG_VulnerabilityChange subtract the 2014 column from the 2024 column in the same release. Conference trends average the available country changes rather than subtracting means drawn from potentially different country sets.

Coverage fields and feature popups

Coverage fields allow readers to distinguish unavailable results from a zero count. A conference can have a valid ND-GAIN context even when a complete LSAP total is unavailable. The fields below should be reviewed alongside the country crosswalk and the relevant metric values.

Field	Meaning
NG_ID	Analysis record identifier linked to copied geometry
NG_Name and NG_ISO	Display name and national ISO3 where available
NG_Year	ND-GAIN reference year 2024
NG_CountryCount	Unique associated geographic units in a conference summary
NG_NDCount	Associated units with an available overall ND-GAIN score
NG_LSAPEligible	Unique units meeting the country overlap rule for LSAP totals
NG_LSAPCount	Eligible units with a known national enrollment value
NG_SpatialCoverage	Capped sum of retained overlaps as a percentage of conference area
NG_Context and NG_DataNote	Aggregation and interpretation notes used in popups

Reading a feature popup

Open a thematic map and select a country or conference feature with the Explore tool. The popup begins with the map question and interpretation. It then displays national context and LSAP counts, associated units and coverage, interpretation notes and sources. Conference popups also include recorded leadership and ecclesiastical figures.

For a conference, compare NG_NDCount with NG_CountryCount to assess overall-score coverage. Compare NG_LSAPCount with NG_LSAPEligible to assess enrollment availability among units eligible for national totals. These checks do not certify completeness of every plan, action or sector field. Inspect the metric and its source values before interpreting a ratio.

NG_SpatialCoverage is a geometric diagnostic. It sums retained overlap fractions and caps the result at 100 percent. The cap and generalized polygons mean it cannot prove complete or nonoverlapping ecclesiastical coverage. A high value does not establish that national LSAP counts are confined to the conference.

Source records and geographic review

Duplicate country records

ISO3	Source IDs	Retained ID	Source country
VAT	95, 238	238	Vatican
MDA	140, 176	140	Moldova
TZA	212, 229	212	Tanzania

The retained ID follows the code's completeness criterion. The values may still need correction or validation at the source; this document does not certify their ecclesiastical accuracy.

Country units without an overall 2024 score

The following 56 mapped records have no usable overall ND-GAIN score in this run. Their absence can reflect territory coverage or a missing source score. LSAP data may nevertheless be present.

American Samoa; Anguilla; Antarctica; Aruba; Bermuda; Bonaire, Saint Eustatius and Saba; Bouvet Island; British Indian Ocean Territory; British Virgin Islands; Cayman Islands; Christmas Island; Cocos (Keeling) Islands; Cook Islands; Curaçao; Falkland Islands; Faroe Islands; French Guyana; French Polynesia; French Southern Territories; Gibraltar; Glorioso Islands; Greenland; Guadeloupe; Guam; Guernsey; Heard Island and McDonald Islands; Isle of Man; Jersey; Juan De Nova Island; Liechtenstein; Martinique; Mayotte; Montserrat; New Caledonia; Niue; Norfolk Island; Northern Mariana Islands; Palestinian Territory; Pitcairn Islands; Puerto Rico; Réunion; Saint Barthélemy; Saint Helena; Saint-Martin; Saint Pierre and Miquelon; San Marino; Sint Maarten; South Georgia and South Sandwich Islands; South Sudan; Svalbard; Tokelau; Turks and Caicos Islands; United States Minor Outlying Islands; US Virgin Islands; Vatican; Wallis and Futuna Islands.

Examples requiring crosswalk review

The Antilles, Pacific and Nordic collections combine many countries and territories, with differing ND-GAIN coverage. Ireland is associated with both Ireland and the UK polygon, but the partial UK association does not contribute to its LSAP total. Related UK conference geometries also include the Isle of Man. Collaborating or pastoral oversight geometries can overlap larger conference records.

These examples explain why map popups retain the associated-unit list and why neither conference counts nor their national LSAP summaries should be added to derive global totals. A legal or pastoral membership claim requires a verified conference directory beyond polygon overlap.

Project files and reproducibility

File or dataset	Purpose
LSAP_ND_GAIN.aprx	ArcGIS Pro project containing the 30 story maps
ND_GAIN_LSAP.gdb	Copied foundations, polygons, intersections, analytical feature classes and tables
Countries_ND_GAIN and Conferences_ND_GAIN	Derived geometry and fields used by thematic layers
Country_Conference_Crosswalk	Retained spatial associations with overlap fractions and eligibility
Layer_Catalog	Map identifiers, calculations, questions, units and suggested uses
E01 to E15 and C01 to C15 lyrx and mapx files	30 reusable layer definitions and 30 map definitions
E01 E02 E04 C01 C04 C15 overview files	Six layout exports in PNG and PDF form
30_Map_Stories.html	Companion guide with all proposals and calculation notes
class_thresholds.json and themes.json	Exact cutpoints and thematic specifications
analysis_validation.json and project_validation.json	Saved analytical and project quality checks

Updating the analysis

A refresh should begin with independent copies of the country and conference foundations and a clearly identified ND-GAIN release. Repeat the ISO matching, duplicate selection, spatial intersections and summary rules. Preserve all exclusions and coverage counts. Recompute relative classifications at each scale, update popup notes, then verify the saved maps and exports.

The reproducibility scripts beside the analysis folder document preparation, joining, analysis, styling and layout rendering. Existing output checks skip some datasets on rerun. A new release therefore requires a new output folder or deliberate rebuild of derived datasets; running the scripts over existing outputs is not a guaranteed refresh.

Keep the project and geodatabase together. The saved project audit records the project hash and current classification counts. The original run's project-preservation check confirms its source project was not changed. A documentation read audit checks map names, fields, sources, feature counts and popup media without modifying the project.
